                  The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the Pro58-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence represents native SK. SK is a secretory protein of plasmin (HPIM), which is a serine protease able to catalyse the hydrolysis of them the protease able to catalyse the hydrolysis of them in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as a cute myocardial infarction. Compared with wild type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. P1 is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever. (Updated on 17-OCT-2003 to standardise OS field)

Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin domains of human fibronectin. binding

Fig 58pp; English.

This sequence represents the human Streptococcus equisimilus streptokinase protein sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, fibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a and

```
pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG: The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of aardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 12-SBP-2003 to standardise OS field)

Also described are: (1) a composition comprising an isolated modified streptokinase, the cc modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising cc administering to the subject a fibrin-dependent streptokinase protein; a cc nucleic acid (1) encoding a modified bacterial streptokinase; (3) an cc expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving cc blood clots in patients with a thrombotic condition, e.g. myocardial cc infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, craft thrombosis and arterial thrombosis. The modified streptokinase can cc also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the cc gresence of fibrin than in the absence of fibrin. The modified cc substrate site for proteolytic cleavage. This reduces the rate of compresents a streptokinase at least two-fold. The present sequence represents a streptokinase at least two-fold. The present sequence from an examile of the nresent invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US-09-940-235-9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the Pro58-Ly859-Ser60-Ly861 segment of the corresponding mative SK is replaced by another amino acid. The present sequence is mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 414 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             thrombolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   No.:

The protein is a recombinant product of a gene fusion construct. The sequence of the synthetic hirudin HV-1 genes was designed based on the published amino acid sequence (Dodt J., et al FEBS Letters 165 180 (1984)). The sequence of streptokinase was obtd. from FCR amplified chromosomal DNA from S. equisimilis ATCC 10009 or ATCC 9642. The primers used for the PCR were based on the pub- lished DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]). The two sequences were used to construct an expression vector in which the streptokinase gene is linked to the hirudin gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring. This fragment was used in the design of a modified streptokinase. This fragment was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus rather than by continuous infusion. (Updated on 17-0CT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                     This sequence represents a fusion protein between maltose-binding protein and the plasminogen-binding fragment of streptokinase. This fusion protein was used in the design of modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion.                                                                                                                                                                                                                                                                                                                            The invention relates to a method for identifying and quantifying one or CC more proteins in complex mixtures by selectively isolating peptides not containing histidine mor arginine (NHNR peptides) from each protein, and determining the relative concentration of one or more proteins in CC different samples from the ratio between the areas of estimated CC theoretical spectra for each NHNR peptide labeled with different isotopes in each sample. The method comprises: (a) enzymatically or chemically CC hydrolyzing the sample or samples of proteins; (b) chemically modifying CC history in step (a); (c) isolating the NHNR peptides by cation exchange CC obtained in step (a); (c) isolating the NHNR peptides by cation exchange chromatography from the mixture of peptides obtained in step (b); (d) differential isotopic labeling of protein contained in step (c); (e) differential isotopic labeling of protein step (c); (e) differential isotopic labeling of protein containing at least a portion of the samples; and (f) relative quantifying of mixing at least a portion of the samples; and (f) relative quantifying of che estimated theoretical spectra of the pair of NHNR peptides containing at least a portion of step (e) from the ratio between the careas of estimated theoretical spectra of the pair of NHNR peptides (c) identified in step (d). Also described is a kit for the identification and quantifying proteins, such as those with vaccinal, therapeutic or containing proteins, such as those with vaccinal, therapeutic or containing protein, which is used in an example from the present a containing protein, which is used in an example from the present a convention.

                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein, (b) identifying in the amino acid sequence one or more potential epitopes for T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune or system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of the SK protein. RESULT 1 US-10-360-101-264

Sequence 264, Application US/10360101 Patent No. 6861236

PATENT NO. 6861336

PATENT NO. 6861366

GENERAL INFORMATION:

APPLICANT: Moll, Gert N.

APPLICANT: Hoenhouts, Cornelis J.

TITLE OF INVENTION: Export and modification of FILE REFERENCE: 2183-5673

CURRENT APPLICATION NUMBER: US/10/360,101

CURRENT FILING DATE: 2003-02-07

PRIOR APPLICATION NUMBER: EP 02077060.8

PRIOR FILING DATE: 2002-05-24

NUMBER OF SEQ ID NOS: 309

COPTWARDE: DATAITON STREET US-09-940-235-9 (1-1541) x US-10-360-101-264 (1-413) Query Match: Best Local Similarity: Score Pred. No.: Alignment Scores: Percent Similarity: US-10-360-101-264 SOFTWARE: PatentIn version 3.1 SEQ ID NO 264 LENGTH: 413
TYPE: PRT
ORGANISM: Artificial Sequence

Patent No. US20020165129A1

GENERAL INFORMATION:

APPLICANT: Kryetal, Gerald

APPLICANT: Rabkin, Simon W.

TITLE OF INVENTION: Cell Death

TITLE OF INVENTION: Cell Death

FILE REFERENCE: 50216/003004

CURRENT PAPPLICATION NUMBER: US/09/919,703

CURRENT PILING DATE: 2001-07-31

PRIOR FILING DATE: 1999-04-19

PRIOR FILING DATE: 1999-04-19

PRIOR PILING DATE: 1995-12-05

PRIOR APPLICATION NUMBER: US 60/008,233

PRIOR PILING DATE: 1995-12-06

PRIOR PILING DATE: 1995-12-06

NUMBER OF SEQ ID NOS: 16

SOFTWARE: FREESEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CATTTAGCT 1181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         381 HisteuAla 383
